

Figure S1: Regression tree for Calgary model, unpruned. The first line in each node is the average proportion of students that used active transportation to school. The second row is the percent of all catchment areas included in that node.

Figure S2: Regression tree for Peel Region model, unpruned. The first line in each node is the average proportion of students that used active transportation to school. The second row is the percent of all catchment areas included in that node.

Figure S3: Regression tree for Toronto model, pruned. The first line in each node is the average proportion of students that used active transportation to school. The second row is the percent of all catchment areas included in that node.

Figure S4: Regression tree for Montreal model, pruned. The first line in each node is the average proportion of students that used active transportation to school. The second row is the percent of all catchment areas included in that node.

Figure S5: Regression tree for Laval model, unpruned. The first line in each node is the average proportion of students that used active transportation to school. The second row is the percent of all catchment areas included in that node.

Figure S6: Regression tree for Surrey model, pruned. The first line in each node is the average proportion of students that used active transportation to school. The second row is the percent of all catchment areas included in that node.

Figure S7: Regression tree for Vancouver model, pruned. The first line in each node is the average proportion of students that used active transportation to school. The second row is the percent of all catchment areas included in that node.
